# Dynamic Memory Allocation

- Programmers use *dynamic memory allocators* (such as `malloc`) to acquire virtual memory (VM) at run time.
  - for data structures whose size is only known at runtime
- Dynamic memory allocators manage an area of process VM known as the *heap*.

# Dynamic Memory Allocation

- Allocator maintains heap as collection of variable sized *blocks*, which are either *allocated* or *free*
- Types of allocators
  - *Explicit allocator*: application allocates and frees space
    - E.g., `malloc` and `free` in C
  - *Implicit allocator*: application allocates, but does not free space
    - E.g., `new` and garbage collection in Java
- Will discuss simple explicit memory allocation today

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# The malloc Package

```
#include <stdlib.h>
```

```
void *malloc(size_t size)
```

- Successful:
  - Returns a pointer to a memory block of at least **size** bytes aligned to a 16-byte boundary (on x86-64)
  - If **size == 0**, returns NULL
- Unsuccessful: returns NULL (0) and sets **errno** to ENOMEM

```
void free(void *p)
```

- Returns the block pointed at by **p** to pool of available memory
- **p** must come from a previous call to **malloc**, **calloc**, or **realloc**

## Other functions

- **calloc**: Version of **malloc** that initializes allocated block to zero.
- **realloc**: Changes the size of a previously allocated block.
- **sbrk**: Used internally by allocators to grow or shrink the heap

Assignment Project Exam Help

Add WeChat powcoder

# malloc Example

```
#include <stdio.h>
#include <stdlib.h>

void foo(long n) {
    long i, *p;

    /* Allocate a block of n longs */
    p = (long *) malloc(n * sizeof(long));
    if (p == NULL) {
        perror("malloc");
        exit(0);
    }

    /* Initialize allocated block */
    for (i=0; i<n; i++)
        p[i] = i;
    /* Do something with p */
    . . .
    /* Return allocated block to the heap */
    free(p);
}
```

<https://powcoder.com>

Add WeChat powcoder

# Sample Implementation

## ■ Code

- File `mm-reference.c`
- Manages fixed size heap
- Functions `mm_malloc`, `mm_free`

## ■ Features

- Based on *words* of 8-bytes each
- Pointers returned by `malloc` are double-word aligned
  - Double word = 2 words
- Compile and run tests with command interpreter

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Visualization Conventions

- Show 8-byte words as squares
- Allocations are double-word aligned.

Assignment Project Exam Help

<https://powcoder.com>

# Allocation Example (Conceptual)

```
#define SIZ sizeof(size_t)
```

```
p1 = malloc(4*SIZ)
```

```
p2 = malloc(5*SIZ)
```

Assignment Project Exam Help

```
p3 = malloc(6*SIZ)
```

<https://powcoder.com>

Add WeChat powcoder

```
free(p2)
```

```
p4 = malloc(2*SIZ)
```

# Constraints

## ■ Applications

- Can issue arbitrary sequence of **malloc** and **free** requests
- **free** request must be to a **malloc**'d block

## ■ Explicit Allocators

- Can't control number or size of allocated blocks
- Must respond immediately to **malloc** requests
  - *i.e.*, can't reorder or buffer requests
- Must allocate blocks from free memory
  - *i.e.*, can only place allocated blocks in free memory
- Must align blocks so they satisfy all alignment requirements
  - 16-byte (x86-64) alignment on 64-bit systems
- Can manipulate and modify only free memory
- Can't move the allocated blocks once they are **malloc**'d
  - *i.e.*, compaction is not allowed. *Why not?*

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Performance Goal: Throughput

- Given some sequence of `malloc` and `free` requests:

- $R_0, R_1, \dots, R_k, \dots, R_{n-1}$

- Goals: maximize throughput and peak memory utilization

- These goals are often conflicting

- Throughput:

- Number of completed requests per unit time
  - Example:
    - 5,000 `malloc` calls and 5,000 `free` calls in 10 seconds
    - Throughput is 1,000 operations/second

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Performance Goal: Minimize Overhead

## ■ Given some sequence of `malloc` and `free` requests:

- $R_0, R_1, \dots, R_k, \dots, R_{n-1}$

## ■ **Def: Aggregate payload $P_k$**

- `malloc(p)` results in a block with a payload of *p* bytes
- After request  $R_k$  has completed, the **aggregate payload**  $P_k$  is the sum of currently allocated payloads

## ■ **Def: Current heap size $H_k$**

- Assume  $H_k$  is monotonically nondecreasing
  - i.e., heap only grows when allocator uses `sbrk`

## ■ **Def: Overhead after $k+1$ requests**

- Fraction of heap space *NOT* used for program data
- $O_k = H_k / (\max_{i \leq k} P_i) - 1.0$

# Benchmark Example

## ■ Benchmark

### syn-array-short

- Trace provided with malloc lab
- Allocate & free 10 blocks
- a = allocate
- f = free
- Bias toward allocate at beginning & free at end
- Blocks numbered 0–9
- Allocated: Sum of all allocated amounts
- Peak: Max so far of Allocated

Step	Command	Delta	Allocated	Peak

20	f 9	-20	0	90036

- Data line shows total allocated data ( $P_i$ )
- Data Fit line shows peak of total ( $\max_{i \leq k} P_i$ )
- Normalized in X & Y

# Full Benchmark Behavior

- **Given sequence of mallocs & frees (40,000 blocks)**
  - Starts with all mallocs, and shifts toward all frees
- **Manage space for all allocated blocks**
- **Metrics**
  - Data:  $P_i$
  - Data fit:  $\max_{i \leq k} P_i$

# Fragmentation

- Poor memory utilization caused by *fragmentation*
  - *internal* fragmentation
  - *external* fragmentation

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Internal Fragmentation

- For a given block, *internal fragmentation* occurs if payload is smaller than block size

Add WeChat powcoder

- **Caused by**
  - Overhead of maintaining heap data structures
  - Padding for alignment purposes
  - Explicit policy decisions (e.g., to return a big block to satisfy a small request)
- **Depends only on the pattern of *previous* requests**
  - Thus, easy to measure

# Internal Fragmentation Effect

- **Perfect Fit: Only requires space for allocated data, data structures, and unused space due to alignment constraints**
  - For this benchmark, 1.5% overhead
  - Cannot achieve in practice
    - Especially since cannot move allocated blocks

# External Fragmentation

```
#define SIZ sizeof(size_t)
```

- Occurs when there is enough aggregate heap memory, but no single free block is large enough

```
p1 = malloc(4*SIZ)
```

Assignment Project Exam Help

```
p2 = malloc(5*SIZ)
```

<https://powcoder.com>

```
p3 = malloc(6*SIZ)
```

Add WeChat powcoder

```
free(p2)
```

```
p4 = malloc(7*SIZ)
```

*Yikes! (what would happen now?)*

- Amount of external fragmentation depends on the pattern of future requests
  - Thus, difficult to measure

# External Fragmentation Effect

## ■ Best Fit: One allocation strategy

- (To be discussed later)
- Total overhead = 8.3% on this benchmark

# Implementation Issues

- How do we know how much memory to free given just a pointer?
- How do we keep track of the free blocks?  
<https://powcoder.com>  
Add WeChat powcoder
- What do we do with the extra space when allocating a structure that is smaller than the free block it is placed in?
- How do we pick a block to use for allocation -- many might fit?
- How do we reuse a block that has been freed?

# Knowing How Much to Free

## ■ Standard method

- Keep the length (in bytes) of a block in the word *preceding* the block.
  - Including the header
  - This word is often called the *header field* or *header*
- Requires an extra word for every allocated block

# Keeping Track of Free Blocks

- Method 1: *Implicit list* using length—links all blocks

Need to tag each block as allocated/free

Assignment Project Exam Help

- Method 2: *Explicit list* among the free blocks using pointers

Need space for pointers

- Method 3: *Segregated free list*

- Different free lists for different size classes

- Method 4: *Blocks sorted by size*

- Can use a balanced tree (e.g. Red-Black tree) with pointers within each free block, and the length used as a key

# Today

- Basic concepts
- **Implicit free lists**

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Method 1: Implicit Free List

## ■ For each block we need both size and allocation status

- Could store this information in two words: wasteful!

## ■ Standard trick

- When blocks are aligned, some low-order address bits are always 0
- Instead of storing an always-0 bit, use it as an allocated/free flag
- When reading the size word, must mask out this bit

*Format of  
allocated and  
free blocks*

**a = 1: Allocated block**

**a = 0: Free block**

**Size: total block size**

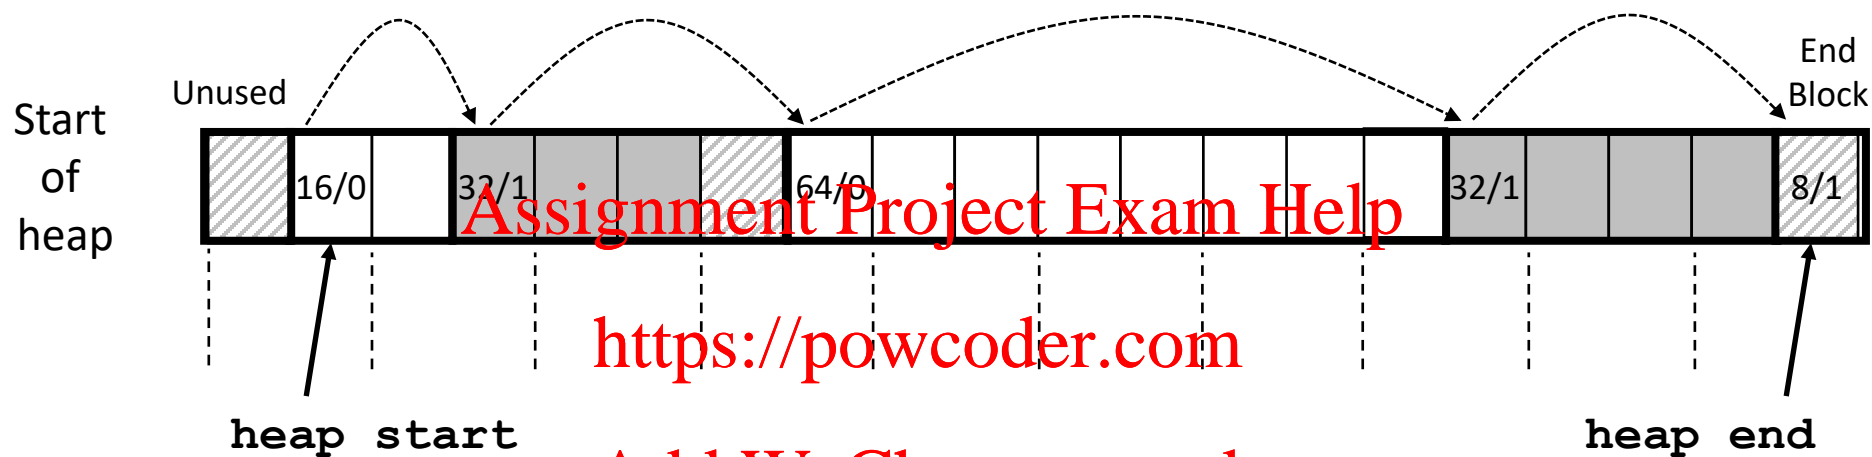

**Payload: application data  
(allocated blocks only)**

Add WeChat powcoder

Assignment Project Exam Help

<https://powcoder.com>

# Detailed Implicit Free List Example

<https://powcoder.com>

Add WeChat powcoder

Double-word  
aligned

**Allocated blocks:** shaded

**Free blocks:** unshaded

**Headers:** labeled with “size in words/allocated bit”

Headers are at non-aligned positions

➔ Payloads are aligned

# Implicit List: Data Structures

## ■ Block declaration

```
typedef uint64_t word_t;
```

```
typedef struct block
```

```
{
    word_t header;
    unsigned char payload[0]; // Zero length array
} block_t;
```

Assignment Project Exam Help

<https://powcoder.com>

## ■ Getting payload from block pointer // block\_t \*block

```
return (void *) (block->payload);
```

## ■ Getting header from payload // bp points to a payload

```
return (block_t *) ((unsigned char *) bp
    - offsetof(block_t, payload));
```

C function `offsetof(struct, member)` returns offset of member within struct

# Implicit List: Header access

Size	a
------	---

- Getting allocated bit from header

```
return header & 0x1;
```

- Getting size from header

```
return header & 0xff;
```

- Initializing header

```
block->header = size | alloc;
```

```
// block_t *block
```

<https://powcoder.com>

Add WeChat powcoder

Assignment Project Exam Help

# Implicit List: Traversing list

## ■ Find next block

Assignment Project Exam Help

```
static block_t *find_next(block_t *block)
{
    return (block_t *) ((unsigned char *) block
        + get_size(block));
}
```

<https://powcoder.com>  
Add WeChat powcoder

# Implicit List: Finding a Free Block

## ■ *First fit:*

- Search list from beginning, choose *first* free block that fits:
- Finding space for **asize** bytes (including header):

```
static block_t *find_fit(size_t asize)
{
    block_t *block;
    for (block = heap_start; block != heap_end;
         block = find_next(block)) {
        if (! (get_alloc(block)
                && (asize <= get_size(block))))
            return block;
    }
    return NULL; // No fit found
}
```

# Implicit List: Finding a Free Block

## ■ *First fit:*

- Search list from beginning, choose *first* free block that fits:
- Can take linear time in total number of blocks (allocated and free)
- In practice it can cause “splinters” at beginning of list

## ■ *Next fit:*

- Like first fit, but search list starting where previous search finished
- Should often be faster than first fit; avoids re-scanning unhelpful blocks
- Some research suggests that fragmentation is worse

## ■ *Best fit:*

- Search the list, choose the *best* free block: fits, with fewest bytes left over
- Keeps fragments small—usually improves memory utilization
- Will typically run slower than first fit
- Still a greedy algorithm. No guarantee of optimality

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

# Comparing Strategies

## ■ Total Overheads (for this benchmark)

- Perfect Fit: 1.6%
- Best Fit: 8.3%
- First Fit: 11.9%
- Next Fit: 21.6%

# Implicit List: Allocating in Free Block

## ■ Allocating in a free block: *splitting*

- Since allocated space might be smaller than free space, we might want to split the block

<https://powcoder.com>

`split_block(p, 32)`

# Implicit List: Splitting Free Block

<https://powcoder.com>

Add WeChat powcoder

```
// Warning: This code is incomplete

static void split_block(block_t *block, size_t asize) {
    size_t block_size = get_size(block);

    if ((block_size - asize) >= min_block_size) {
        write_header(block, asize, true);
        block_t *block_next = find_next(block);
        write_header(block_next, block_size - asize, false);
    }
}
```

# Implicit List: Freeing a Block

## ■ Simplest implementation:

- Need only clear the “allocated” flag
- But can lead to “false fragmentation”

Assignment Project Exam Help

<https://powcoder.com>

Add WeChat powcoder

`malloc(5*SIZ)`

***Yikes!***

***There is enough contiguous free space, but the allocator won't be able to find it***

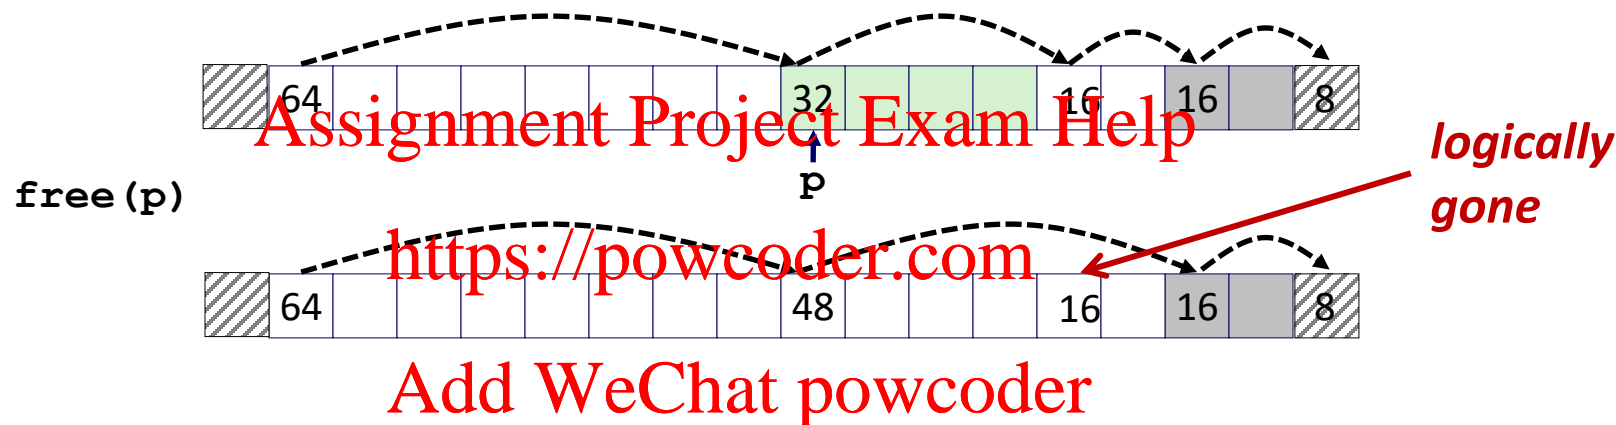

# Implicit List: Coalescing

- Join (*coalesce*) with next/previous blocks, if they are free
  - Coalescing with next block

# Implicit List: Coalescing

- Join (*coalesce*) with next block, if it is free
  - Coalescing with next block

- How do we coalesce with *previous* block?
  - How do we know where it starts?
  - How can we determine whether its allocated?

# Implicit List: Bidirectional Coalescing

## ■ **Boundary tags** [Knuth73]

- Replicate size/allocated word at “bottom” (end) of free blocks
- Allows us to traverse the “list” backwards, but requires extra space
- Important and general technique!

Assignment Project Exam Help

# Disadvantages of Boundary Tags

- Internal fragmentation

- Can it be optimized?

- Which blocks need the footer tag?
- What does that mean?

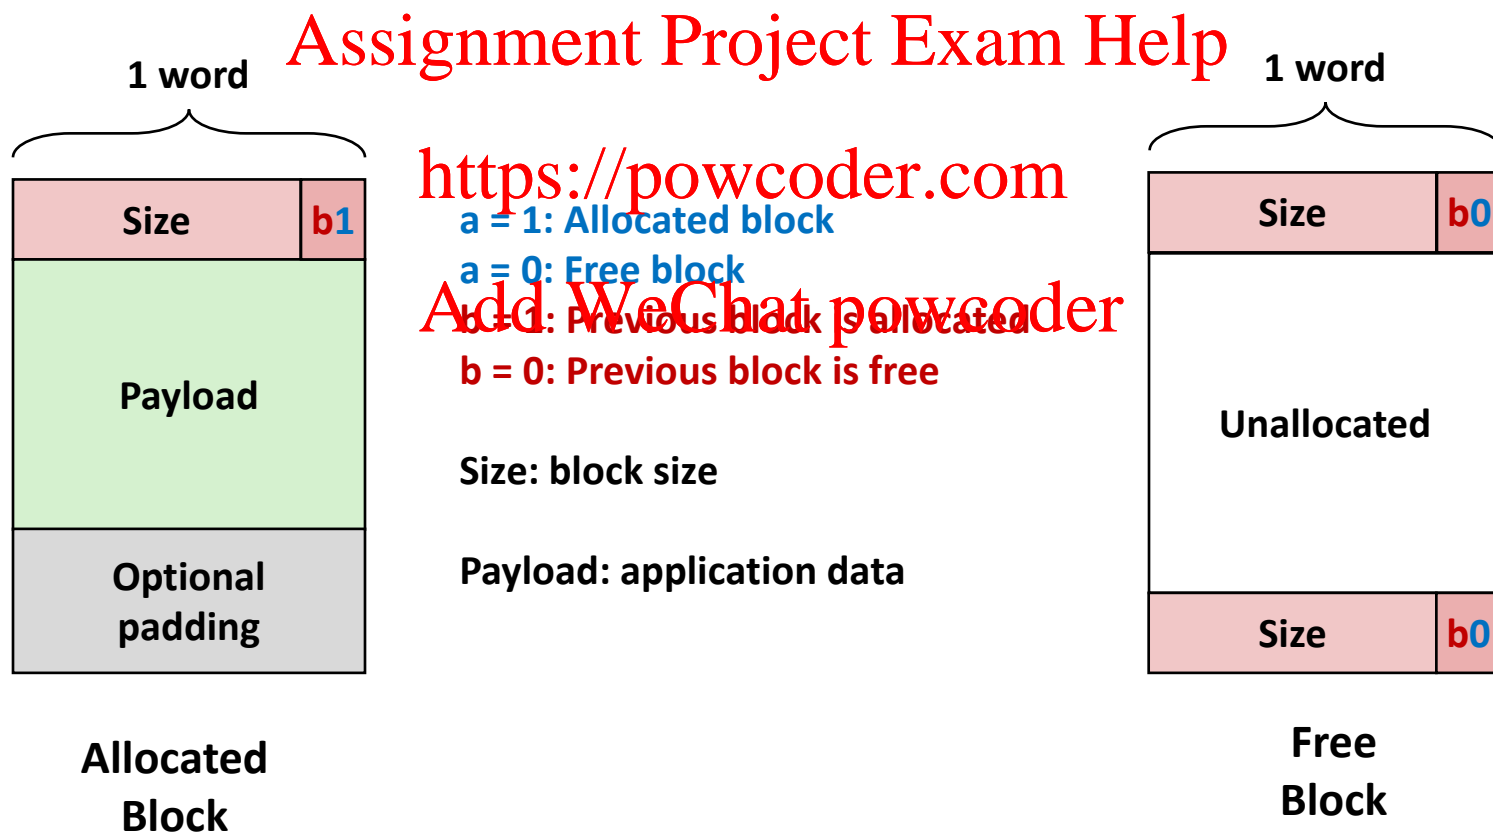

Assignment Project Exam Help

<https://powcoder.com>

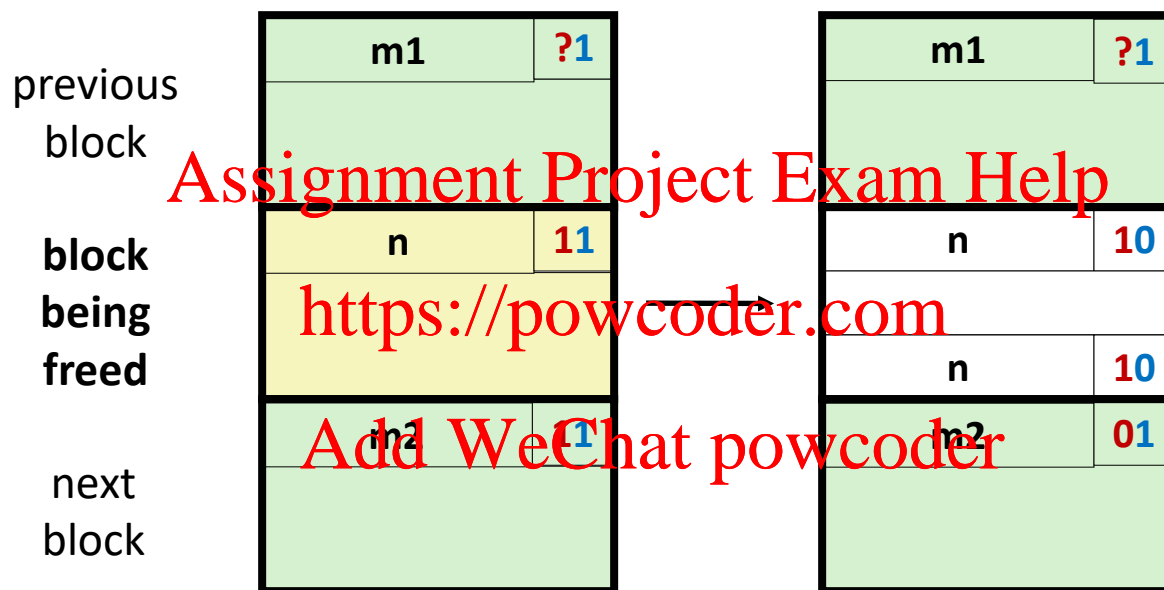

Add WeChat powcoder

# No Boundary Tag for Allocated Blocks

- Boundary tag needed only for free blocks
- When sizes are multiples of 16, have 4 spare bits

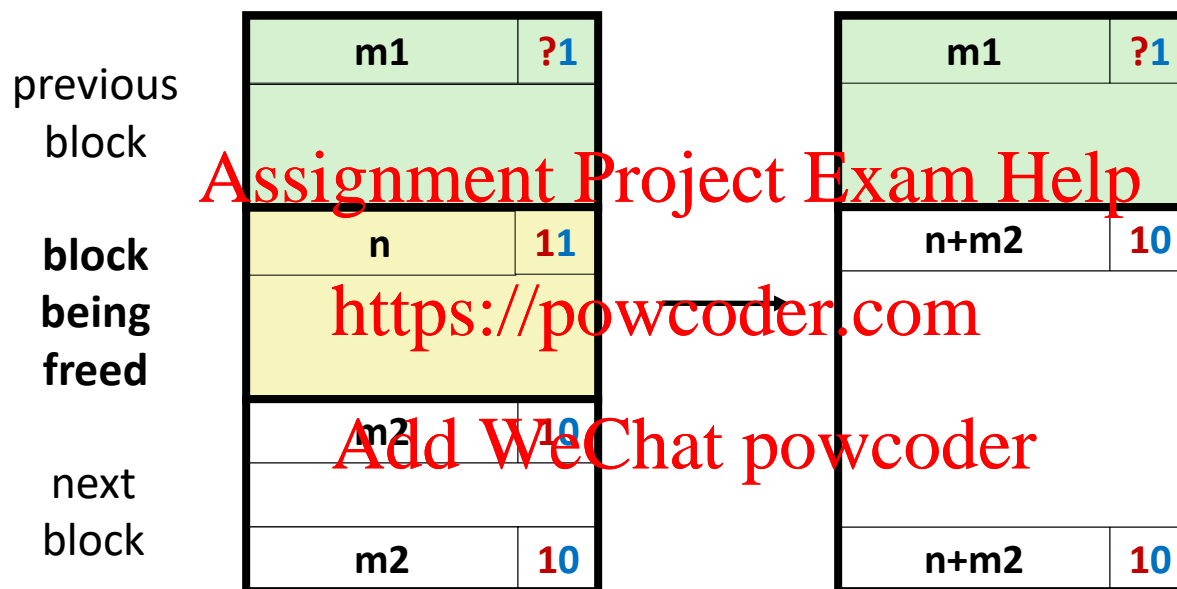

# No Boundary Tag for Allocated Blocks (Case 1)

**Header:** Use 2 bits (address bits always zero due to alignment):  
 (previous block allocated) << 1 | (current block allocated)

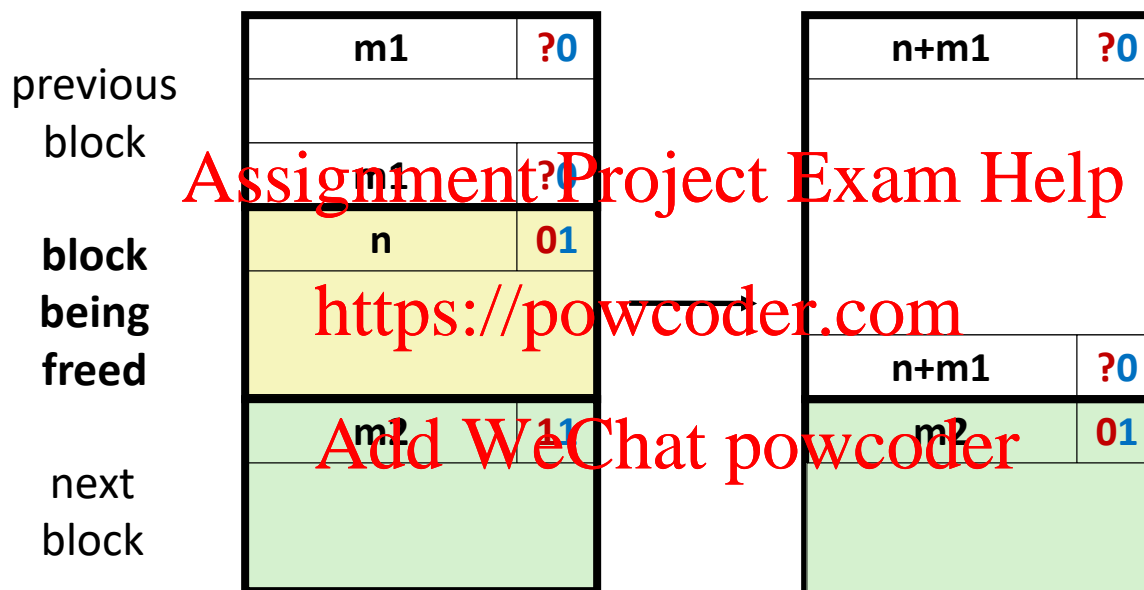

# No Boundary Tag for Allocated Blocks (Case 2)

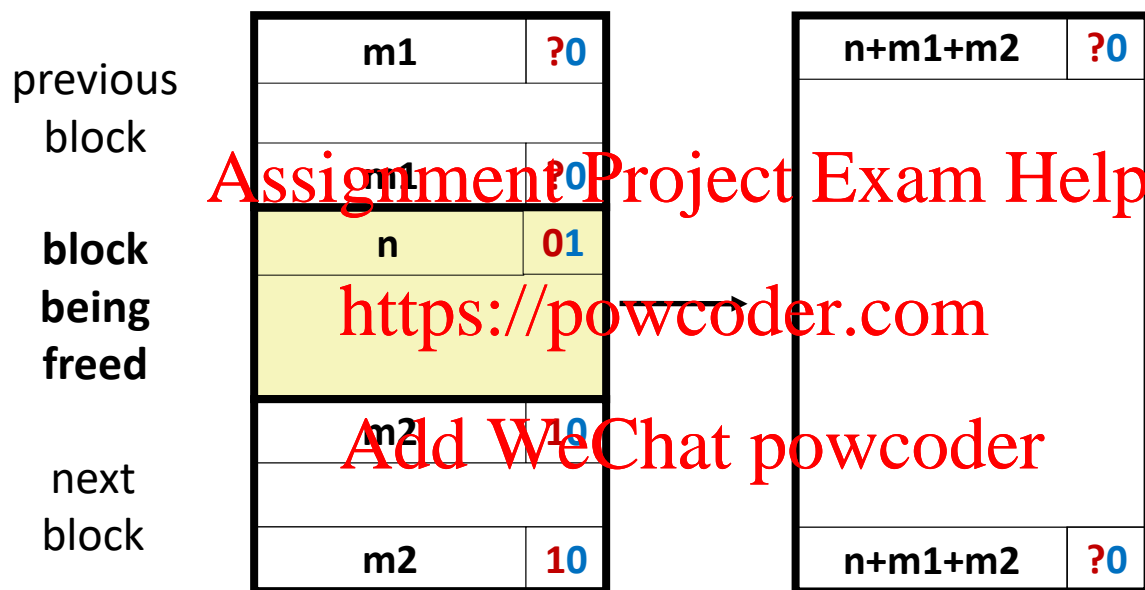

Header: Use 2 bits (address bits always zero due to alignment):  
 (previous block allocated) << 1 | (current block allocated)

# No Boundary Tag for Allocated Blocks (Case 3)

Header: Use 2 bits (address bits always zero due to alignment):  
 (**previous block allocated**) $\ll 1$  | (**current block allocated**)

# No Boundary Tag for Allocated Blocks (Case 4)

Header: Use 2 bits (address bits always zero due to alignment):  
 (previous block allocated)<<1 | (current block allocated)

# Summary of Key Allocator Policies

## ■ Placement policy:

- First-fit, next-fit, best-fit, etc.
- Trades off lower throughput for less fragmentation
- **Interesting observation:** segregated free lists (next lecture)  
approximate a best fit placement policy without having to search entire free list

## ■ Splitting policy: <https://powcoder.com>

- When do we go ahead and split free blocks?
- How much internal fragmentation are we willing to tolerate?

## ■ Coalescing policy:

- **Immediate coalescing:** coalesce each time **free** is called
- **Deferred coalescing:** try to improve performance of **free** by deferring coalescing until needed.

Assignment Project Exam Help

Add WeChat powcoder

# Implicit Lists: Summary

- **Implementation: very simple**
- **Allocate cost:**
  - linear time worst case
- **Free cost:**
  - constant time worst case
  - even with coalescing
- **Memory Overhead**
  - will depend on placement policy
  - First-fit, next-fit or best-fit
- **Not used in practice for `malloc/free` because of linear-time allocation**
  - used in many special purpose applications
- **However, the concepts of splitting and boundary tag coalescing are general to *all* allocators**
